

# **KOHLER**® Diesel KDI

**KOHLER**®

**STARTING FROM A CLEAN SHEET, THE KOHLER STRATEGY FOR THE DESIGN OF THE NEW KDI ENGINE FAMILY HAS BEEN FOCUSED ON UTILISING STATE OF THE ART**

**TECHNOLOGY TO CONTROL THE COMBUSTION PROCESS TO PROVIDE A BEST IN CLASS ENGINE BOTH FOR PERFORMANCE AND ALSO EXHAUST GAS EMISSIONS.**

**EXCELLENT POWER AND TORQUE CHARACTERISTICS WILL NOT ONLY PROVIDE CUSTOMERS WITH OPPORTUNITIES TO DOWN-SIZE FROM THEIR CURRENT ENGINE**

**DISPLACEMENT, BUT ALSO TO SIGNIFICANTLY REDUCE FUEL CONSUMPTION AND AVOID EXPENSIVE DIESEL PARTICULATE FILTRATION (DPF) DEVICES.**

#### COMMON-RAIL SYSTEM

Kohler has selected the most advanced common-rail system available on the market and specifically engineered for extreme durability and longevity within arduous industrial and construction equipment applications. The 2000 bar high pressure pump, together with the advanced multiple-injection control of the solenoid-injectors, allows an excellent fuel rate control during the injection process.

#### TURBOCHARGER AND CHARGE-AIR COOLER

The waste-gated turbocharger has been specifically tuned to minimize the turbo-lag response and provide the precise volume of air for an excellent low end torque capability. The special design of the lubrication system guarantees extended durability of the turbocharger. The use of a charge air cooler is required to ensure the correct air inlet temperature for the optimal engine performance whilst achieving emissions compliance.

#### 4 VALVES

The 4 valves per cylinder design has been selected to enable the installation of the injectors precisely on the cylinder axis and centred with the combustion bowl. This solution allows for a symmetrical fuel atomisation and distribution within the combustion bowl ensuring optimal mixing of fuel and air. The design of the combustion bowl itself together with the inlet ports shaping, have been studied and developed with CFD analysis to complete the absolute optimization of the combustion process.

## INNOVATIONS

#### ECU

The engine electronic control unit (ECU), together with the common rail injection system, is a part of the most advanced automotive style engine management system and has been specifically developed for industrial and construction equipment applications. It allows a full control of the engine calibration parameters to achieve the engine performances and emissions targets. A CAN bus link allows the ECU to interface with other electronic systems within the final application in order to optimize the engines operating parameters. Options of specific functionalities have been enabled within the ECU in order to provide OEMs with different governing characteristics ensuring total compatibility with individual equipment.

#### EGR SYSTEM

The Exhaust Gas Recirculation (EGR) system has been designed with CFD analysis and the use of comprehensive research and development resources. The chosen design of a "hot side" EGR layout will avoid valve sticking problems that are historically the most common failures seen within these systems. Exhaust gas routing across the cylinder head ensures a beneficial preliminary gas cooling before entering the EGR valve to reduce the overall dimensions of the unit to assist installation parameters.

TIER 4 FINAL/STAGE III B COMPLIANCE

EXCELLENT FUEL EFFICIENCY

LONG SERVICE INTERVALS

EASY MAINTENANCE

**BENEFITS**

LOW VIBRATIONS

REDUCED NOISE

COMPACT

NO AFTER TREATMENT, NO HEAT REGENERATION

# TURBO COMMON RAIL ENGINES

## STANDARD EQUIPMENT

- Intake manifold
- Exhaust manifold
- Side oil refilling
- Electric starter
- 80A alternator
- SAE 4 (7" ½)
- Cabin heating predisposition
- Oil filter engine mounted
- Fuel filter with water sensor
- Environmentally friendly oil filter
- ECU
- Oil sump capacity 8.5 L (KDI 1903) and 11.3 L (KDI 2504)
- Diesel oxidation catalyst (DOC)

## ACCESSORIES ON DEMAND

- SAE 3 (11" ½)
- Radiators with integral charge air cooler
- Mounting feet
- Heavy duty air cleaner
- Hydraulic pump provision on 3rd and 4th PTO
- 100A alternator

# KDI 1903TCR
